NOTES

The aim of this publication is to provide users with a range of the latest statistics available at the end of each month of issue. Consequently the dates and periods shown are not always the same for each table, but are in each case the latest figures available at that time.

Seasonal adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal variations from economic time series so the the effects of other influences are obvious. Seasonal variations are the systematic (though not necessarily regular) intra-year movements of economic time series. These are often the result of non-economic phenomena, such as climatic changes, and regular religious festivals e.g. Christmas and Easter.

Trend Estimate

Smoothing seasonally adjusted series produces a measure of trend by removing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson weighted moving average to the respective seasonally adjusted series. Readers are reminded that trend estimates are subject to revision as subsequent months' data become available.
